dielectric medium 5 in inequality 1.

(57) Abstract:

COPYRIGHT: (C)1983,JPO&Japio

PURPOSE: To decrease line loss, by inserting a dielectric layer satisfying a specific condition to a dielectric medium among each conductor flat plate, the dielectric medium and a dielectric strip for suppressing radiation due to bents and the discontinuity of the line.

CONSTITUTION: Two conductor plates 1, 2 are arranged in parallel, the dielectric strip 6 having a larger dielectric constant than that of a medium 5 is inserted to the dielectric medium 5 existing between the flat plates 1 and 2 and dielectric layers 3, 4 are sandwiched between the flat plates 1, 2 and the medium 5 and the strip 6 respectively. The dimensions of the dielectric layers 3, 4 are set to satisfy inequality 1, the electric field of electromagnetic waves is polarized in parallel with the flat plates 1, 2 for suppressing the radiation due to the bents and the discontinuity of the line, allowing to decrease the line loss, where ϵ_{r1} is a specific dielectric constant to the dielectric medium 5, (a) is a distance between the flat plates 1 and 2, (c) is thickness of the dielectric medium 5 and λ_0 is the wavelength of the electromagnetic waves in the

$$\tan\left(\frac{\pi c}{\lambda_0}\right) < \sqrt{\epsilon_{r1}} \cot\left(\sqrt{\epsilon_{r1}} \pi \frac{a-c}{\lambda_0}\right) \quad 1$$
